CERTIFICATION FROM THE SUPERVISORS

This is to certify that the thesis entitled **INTERPRETABLE MULTI-HORIZON TIME SERIES FORECASTING OF CRYPTOCURRENCIES BY LEVERAGE TEMPORAL FUSION** submitted by Arslan Farooq to the Kohat University of Science & Technology for the award of **MSDS degree** and presents bona fide research work carried out under our supervision. This research work is not submitted elsewhere to any other Institution for an award of any degree/ diploma.

CERTIFICATION FROM THE EXAMINERS

This is to confirm that the work presented in this thesis is an accurate account of the original study conducted by **Arslan Farooq** in the partial completion of the degree of MSDS from the **MSDS** Kohat University of Science & Technology, Kohat. If all other conditions are satisfied, we deem the work sufficient for the award of the degree. The Viva Voce continued _____ .

ACKNOWLEDGEMENT

I am grateful to **ALMIGHTY ALLAH**, the kindest and most compassionate of all creatures, and I prostrate before Him for bestowing upon me good health, gifted teachers who worked hard, wonderful friends, and the growth of my intellectual abilities. The **Holy Prophet MUHAMMAD (P.B.U.H.)** life and teachings serve as a beacon of illumination for the whole mankind.

This thesis is the fulfilment of a long-anticipated wish, and it would still be a wish if I had disregarded the enormous encouragement and support of so many people in my immediate environment.

I am incredibly grateful to **MS Supervisor-I: Dr. M. Irfan Uddin**, for allowing me to conduct research in such an inexplicable manner while under his supervision. His advice has consistently provided me with insight, and I have learned a lot more from him than I have from study.

I appreciate the assistance I have received from my **MS Supervisor-II: Dr. Muhammad Adnan**, as well as from other graduate students as well as colleagues at the **Institute of Computing at KOHAT UNIVERSITY OF SCIENCE & TECHNOLOGY, Kohat**. Without their suggestions, I might not have been able to complete this work. I must acknowledge the department's amenities and surrounds.

I gratefully thank each teacher who helped me learn a term during my academic career as well as throughout my life.

DEDICATION

My family and numerous friends deserve a special mention in my dissertation. I would especially want to thank my devoted parents, whose words of support and push for persistence still echo in my ears. This dissertation is also dedicated to all of my numerous relatives and close friends who have supported me greatly during the process. I will always be thankful to each and every one of them, especially Arslan Tariq for helping me advance my technological knowledge, M.Ayoub for her many hours of corrections.

Abstract

With the help of the study, a model named ADE-TFT will be created that will allow investors to forecast important developments in the cryptocurrency markets and make wise choices. To optimize hyperparameters and enhance prediction accuracy and stability, the model applies the Adaptive Differential Evolution (ADE) approach and Temporal Fusion Transformers (TFT) framework. Although Bitcoin's volatility has presented difficulties for investors, the suggested methodology has the potential for improving efficiency and accuracy in market predictions. The study's findings show that ADE-TFT produced favorable performance measures, including a Mean Absolute Percentage Error (MAPE) of 32.174 and a Root Mean Square Error (RMSE) of 32532, indicating its potential relevance in the decision-making process for bitcoin investments.

Chapter 1

Introduction

With the rise of global economic challenges in recent years, traditional currency values have fallen, stock markets are collapsing, and investors are losing wealth. Meeting costs and earning profit have changed the thinking of investors to focus on a digital currency. With the introduction of Bitcoin (BTC) in 2009, cryptocurrency trading started, bringing with it two key differences from conventional trading. Firstly, Cryptocurrency is one such application built on the blockchain that exists virtually and has a decentralized system to account for all transactions. Since individuals put everything on the ledger, those who own digital currencies can make global exchanges immediately rather than requiring a portion of a day

tor because of its extreme volatility and uncertainty [1]. As a result, the efficiency of the market is impacted by reduced daily trading volume and less experienced investors. This thesis aims to use the proposed model for cryptocurrency markets to forecast significant events and make better-informed investment decisions.

In this chapter, it is made clear how important the area of the subject is. The important difficulties are covered in detail, along with the recent techniques and developments. This chapter also includes a summary of our main research objectives and limitations.

1.1 Background

A significant number of academic works have already examined the prediction of financial time series. Financial asset managers are always attempting to develop investment strategies by identifying financial assets, such as stocks and commodities, that will outperform or lag the market. Small improvements in the financial
